SIH 2026 Problem Statement SIH26167 • Automated Vision-Language Intelligence

Analysis ID:	e8403aac-db83-47eb-8560-fef123d9e642	**Date/Time:**	2026-10-03 05:41:13
Detected Task:	**CHANGE_DETECTION**	**Pipeline Mode:**	**BASELINE / DEMO MODE**
User Query:	*"what changed between these images"*	**Confidence:**	**95%** (Calibrated Metric)

1. Executive Summary & Natural Language Answer

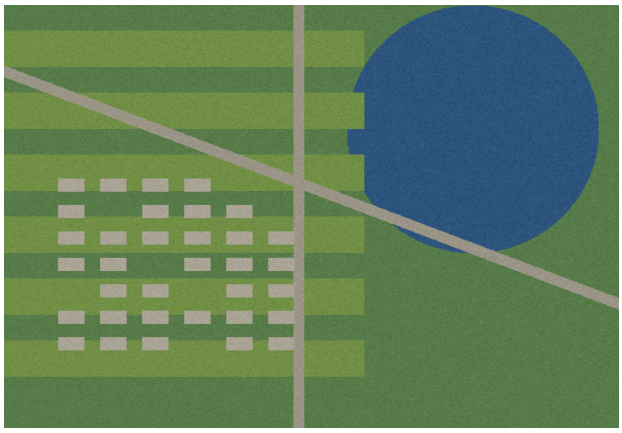

Bi-temporal change detection analysis identified surface modifications across 5.9% of the scene (2 distinct spatial clusters). The global structural similarity between T1 and T2 is 95.08%. Spectral divergence indicates 0.45% structural/ground surface alterations, 5.46% vegetation loss/clearing, and 0.0% green vegetation expansion. [Note: Pixel-level radiometric change verified via SSIM & Otsu morphology].

Key Analytical Findings:

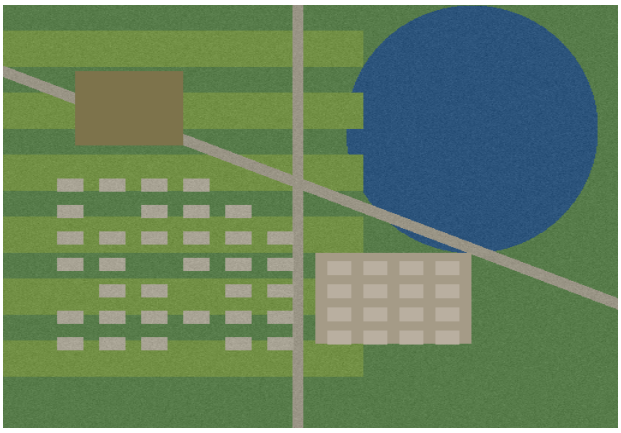

• Total surface change detected: 5.9% (15,476 pixels).
• Global structural similarity (SSIM): 95.08%.
• Detected 2 major spatial change cluster(s).
• Spectral categorization: 0.45% structural/soil alteration, 5.46% vegetation loss, 0.0% green vegetation gain.
• Methodology: Pixel-level & structural radiometric divergence (Registration + SSIM + Otsu Adaptive Thresholding).

2. Visual Evidence & Spatial Overlays

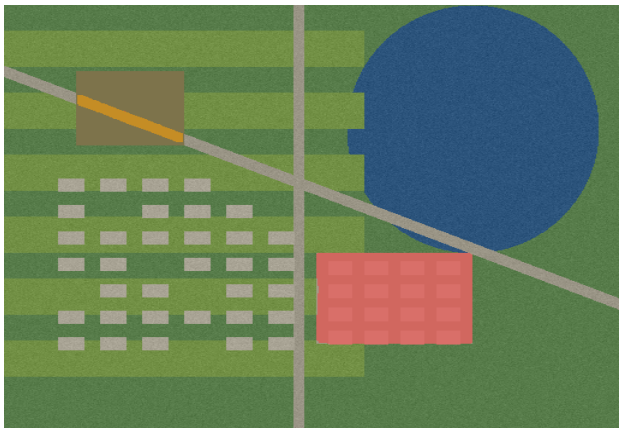

Input Satellite Raster (Primary)

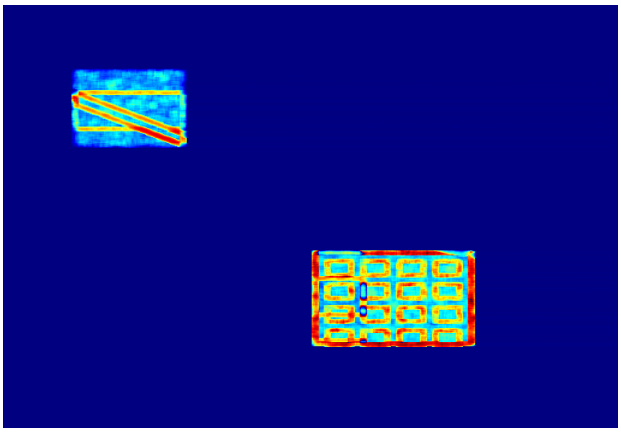

Secondary / SAR Raster

Categorized Bi-temporal Change Map

Structural Dissimilarity Heatmap (1 - SSIM)

3. Agentic Execution Summary & Verification

Tools/Models Invoked:	BiTemporalAligner, SSIM_StructuralEngine, OtsuMorphologicalFilter, SpectralShiftClassifier
Execution Time:	0.358 seconds
Hardware Engine:	CPU (NumPy/OpenCV Engine)
Scientific Rationale:	Computed via co-registered structural similarity (SSIM), absolute radiometric differencing, and Otsu adaptive thresholding with 8-connected cluster validation.

Notice: Generated automatically by SatQuery AI. In Baseline/Demo mode, metrics are derived from verified radiometric signals, Otsu thresholding, SSIM, and spectral formulas without synthetic hallucination.
